

Pathfinder Challenge

Now that you have some basic PHP skills, under your belt your next task is to create a Forum for the young start-up called MEAT LABS Inc. The client is only expecting the core functionality to be completed, therefore he doesn't want a fancy looking forum. If there's enough time and budget for that then making it look good will be a nice little bonus.

The core functionality for the forum is as follows:

- Users can log in with email and password or register,
- When a new user is registering for the site, the basic information that is collected is as follows:
 - First Name
 - Last Name
 - Email
 - Password - hashed
 - Username
- Upon user login, a user lands on the main forum page and sees all of the posts that have been created along with their author's name.
- A user can create new posts with the following minimum fields:
 - Title
 - Body

BONUS: The client would like the following additional functionality so long as the core functionality is done.

- A user can create a comment on a post with the following minimum field
 - Comment
- A user can remove his post or his comment.
- A user dashboard that lists all the posts they created.
- Make the site visually appealing using bootstrap or another UI library

You can use all of the resources provided including the instructor for this project. Submissions can be done as a zip file or a link to a github repository.
